

# RADIATION THERAPY INFORMATION GUIDE

External radiation therapy  
for lung cancer

Name of my radiation oncologist: \_\_\_\_\_

Department phone no.: **418-691-5264**

Consult this document on: [www.chudequebec.ca/Radiotherapie\\_poumon](http://www.chudequebec.ca/Radiotherapie_poumon)

## Introduction

Your health condition requires you to have radiation therapy. This guide contains information about:

- What radiation therapy is;
- The steps involved in planning your treatments;
- What will happen during your treatments;
- The possible side effects;
- Recommendations during treatments.

## The centre

The radiation oncology centre at CHU de Québec-Université Laval is a supraregional centre with a mission to:

- Provide quality treatments;
- Promote research;
- Participate in student training;
- Evaluate new technologies.

You may be asked to participate in research projects during your treatments. You may also be seen by students during your visits. Students are always closely supervised by a health professional in their field.

## Your team

- The **radiation oncologist** (your doctor) will meet you for a consultation. After reviewing your file, speaking to you and examining you, the doctor will decide whether you are a candidate for radiation therapy. He will oversee every step of your treatment.
- The **nurse** will be involved in assessing your physical and mental condition and will manage your symptoms during your treatments.
- **Radiation therapists** will be there to support you during your radiation therapy treatments (from preparation to administration).
- Depending on your condition, you may need to see other team members before or during your radiation therapy treatments, including a **nutritionist, social worker, psychologist** or **pivot nurse**.

## What is radiation therapy?

Radiation therapy is a treatment that uses high energy X-rays or electrons to treat tumours (benign or malignant).

A machine called a linear accelerator is placed near your body. This machine gives a predetermined dose of radiation at the part of the body where the tumour is located. It can be moved in different directions.

Your treatment team checks the machines daily to make sure they're accurate and working properly.

The goal of the treatment is to destroy the cancer cells, while protecting the surrounding healthy tissue as much as possible.

Radiation therapy is painless, odourless and invisible. As soon as the treatment is over, the machine stops releasing radiation. You will not become radioactive after your treatments, and there is no danger to anyone around you.

## Radiation therapy and other treatments

For some types of tumours, radiation therapy is used on its own. In other cases, it is used in combination with surgery and/or chemotherapy.

The treatment choice is based on accepted practices and a joint decision between you and your doctors.

### First visit

#### *Review of your medical file*

In most cases, you will not have any treatment at your first radiation oncology visit. Your radiation oncologist will review your medical file and examine you, after which they will prescribe the appropriate treatment.

It's important to know that other steps need to be taken before your first treatment, which explains the delay between your first appointment and your first treatment.

At this visit, it's important to tell your doctor if you have an implantable electronic or other medical device (e.g., pacemaker, insulin pump, hearing aid). To avoid malfunction, manufacturers recommend removing some of these devices during pre-treatment examinations or treatments.

## Second visit

### *Planning your treatment*

These steps take anywhere from 40 to 75 minutes.

#### 1. Molding

The radiation therapists will help you find the most comfortable position for your treatments. This is the same position that will be used for all the treatments. Therefore, it's important to mention any discomfort or pain.

#### 2. CT scan

A CT scan will be done to pinpoint the area to be treated. It will give measurements to decide the best way to administer the radiation needed to treat you.

**You must lie completely still during the CT scan.**

Your doctor may order a CT scan with contrast (iodine injection). If so, you'll be given the instructions for this test.

#### Marking

Marks will be drawn on your skin. They will be used as landmarks by the radiation therapists during your treatments. Don't worry—the marks are often bigger than the area to be treated.

- **The red markings are temporary.** You will need to keep them on throughout your treatments. Do not remove them, as they are needed to ensure accuracy.

#### A few tips:

- When washing, do not place your marks directly under the running water.
- Pat yourself dry with a towel. Do not rub the skin.
- The ink will stain clothing.

**If the marks look like they're fading,** call the radiation oncology department. We will tell you what to do.

- **A few dots can be tattooed on your skin.** These are permanent, so there's no risk of them being washed off.

#### 3. PET scan

A PET scan can be done to help us locate the area to be treated.

**You must lie completely still during the PET scan.**

#### 4. MRI

A MRI can be done to help us locate the area to be treated.

**You must lie completely still during the MRI.**

#### 5. Pre-treatment waiting period

After those exams, there will be a delay while the team plans your treatment. The radiation therapists will let you know how long this will take. It may take longer if your doctor is waiting for test results. In all cases, we will adhere to the standards set by the Ministère de la Santé et des Services sociaux.

You will be notified by phone of the date and time of your first treatment. Treatments can begin any day of the week.

Some accessories may be used to help you stay in this position.

# Treatments

## Number of treatments required

The number of radiation therapy treatments depends on the assessment of your health condition and your file. This number is not a reflection of the seriousness of your cancer.

Treatments are usually given daily, five days a week, from Monday to Friday. They last from 1 to 8 weeks, depending on the type of cancer.

Your machine may be out of commission one day or two for maintenance. In that case, you will be notified a few days in advance.

You will meet other patients during your visits, but it's important to remember that your treatments are personalized and tailored to your individual needs.

## During the treatment

You will always be greeted by a radiation therapist. They are familiar with your treatment plan. They will take the time to answer your questions.

Based on the marks on your skin, you will be lined up under the machine in the proper position.

For accuracy reasons, it's important to lie very still during the treatments. However, you can breathe normally.

The radiation therapists will leave the room while the machine is running. They will be in an adjacent control room watching you on a screen. They can hear everything you say and speak to you over an intercom.

The radiation lasts only a few minutes. However, it takes about 20 minutes to get set up.

Verification images are taken at each treatment to check your position. They are not meant to see how your tumour is responding to treatment.

## Side effects

Radiation therapy is a treatment that can affect normal tissue and cause side effects.

The side effects of radiation therapy can also be affected by chemotherapy and/or surgery. However, the effects of these other treatments will not be discussed here.

*These side effects don't always happen. Their seriousness depends on the person, the type of disease, the dose of radiation, and the area treated.*

### Here is a list of possible side effects and when they tend to appear

#### *A few days after the beginning of the treatments*

Most of these side effects are temporary and will disappear within a few weeks after the radiation therapy.

#### **Probable side effects**

- Fatigue
- Decreased appetite
- Skin redness
- Cough and increased nasal secretions
- Irritation of the esophagus:
  - Pain or burning in the esophagus and/or stomach
  - Pain or a feeling of food being stuck in the throat when swallowing

#### **Less common side effects**

- Irritation of the membrane around the heart (pericarditis):
  - May appear up to 6 months after radiation therapy
  - May cause chest pain, shortness of breath, palpitations
- Lung irritation:
  - May appear up to 6 months after radiation therapy
  - May cause cough, fever and/or shortness of breath
  - Disappears spontaneously after a few months or with medication (for uncomfortable side effects)

#### *In the months or years following radiation therapy*

#### **Probable side effects**

- Sensitivity, pain in the chest wall
- Loss of flexibility and/or stiffness of the tissues under the skin (especially when the treatment includes part of the neck)
- Scarring on the part of the lung treated (fibrosis) that may cause shortness of breath and cough, or aggravate existing symptoms

#### **Less common side effects**

- Rib fracture and/or crushed vertebra in the irradiated area
- Increased risk of heart disease
- Blood vessels may become visible on the surface of the skin
- Narrowing of the esophagus and difficulty eating

#### **Very rare side effects**

(less than 1 in 1,000 patients: 0.1%)

- Injury and permanent nerve damage in the arm on the treated side, which may cause pain and abnormal sensations such as numbness and/or weakness
- Cancer caused by radiation therapy
  - The benefits of treatment outweigh this very low risk
- Spinal cord injury that may cause paralysis

418 691-5264

*Rarely, other side effects may occur that we cannot predict.*

*However, if you develop side effects that are causing discomfort, **feel free to contact us.***

## Medical follow-up

During your treatments, your radiation oncologist will meet with you about once a week. No appointments are necessary. A schedule is posted on the bulletin board each week indicating the day your radiation oncologist will see you. This schedule will be explained at your first treatment.

## Recommendations during treatments

### *General advice*

- Tell the radiation therapist, the nurse or the radiation oncologist if you develop any side effects.
- Make sure you get plenty of rest but still stay active.
- Let a team member know if you experience pain while eating or drinking.
- Let a team member know if you develop a fever ( $\geq 38.3$  °C).  
It's very important to follow the oncology team's instructions.
- **Follow the nutritionist's advice.**
- **If you have the potential to get pregnant, use an effective method of birth control during your treatments.**

*Skin care*

- As needed, apply a fragrance-free moisturizer at least once a day to the treated area.

*Sun exposure*

- Do not expose the treated area to the sun during treatments. After the treatments, you should use sunscreen to protect your skin if exposing it to the sun.

*Smoking*

- You should abstain from smoking during your treatments and quit permanently afterwards. Support is available at [tobaccofreequebec.ca/iqnitnow](http://tobaccofreequebec.ca/iqnitnow) or by calling 1-866-JARRETE (1-866-527-7383). You can also talk to your doctor or pharmacist about other resources to help you quit.
